

PRESS BRIEF

a card and game studio – with a token that burns so the art can live

FOR • SUPERRARE LIQUID EDITIONS • COHORT 01 ARTIST • GIANNI ARONE (lovebeing)

NOT FINANCIAL ADVICE • NOTHING HERE IS AN OFFER • ALL MEMES ARE MEMES

A card studio that ships a token — *not* a token that ships cards.

ripmaster3030studios is a trading-card and game studio by Gianni Arone (lovebeing). Its edition, \$3030, is a SuperRare Liquid Edition, and every card in the deck is a **Liquid Lens** — a render that reads the chain and changes with it.

The deck is **100 cards**. There are **six arcade cabinets** you can play right now. And the token's only job is to be **spent**: you rip packs with it, you wager it, and a share of every rip is destroyed permanently.

The studio is ripmaster3030studios. The edition it issues is \$3030. A company and its product may differ — both spellings are correct in their own place.

THE LINE

“The token burns so the art can live.”

Packs are bought and burned. The supply only ever goes down. Nothing is staked for yield, nothing pays a return, and there is nothing to claim — the prize is the card, and the having-done-it.

Gianni Arone · lovebeing · @_lovebeing_

Came up as a **Fake Rares** artist, in the lineage **Rare Pepes** on **Bitcoin/Counterparty** began – the first people to treat a trading card as a native digital object. Found a love and a knack for making cards, and has been making them since.

The throughline is **anticipation**. **MAD magazine** and **cereal boxes** – a picture that is a joke, a trophy and a currency at once. **The casino and the arcade** – the machine that promises you win something tangible. **The auction** – the promise of value received. The rip, the pull, the reveal, the bid.

THE DADAIST TURN

Sometimes the thing you win is the experience itself.

Which makes this an **anti-casino**: all the same anticipation, but the tangible prize is a thing you made or did – never a payout. It parodies crypto / KOL / meme-coin culture **as art**, with generic archetypes, clearly as satire, and never deceptively.

Every card is a lens. The artwork is generated at fetch time, from chain state.

33

HERO 1/1S · THE GENESIS SET

Split three ways on purpose – **11 at auction**, **11 pulled from packs**, and **11 EARNED**: named feats in the studio's own cabinets, first claimant takes it and it closes forever.

67

FIELD LENSES

They render **without needing to be minted**. The deck is browsable and alive before a single one changes hands.

1

LOVEBEING · HOLDER-BOUND

One per wallet. Non-transferable and non-burnable. It is not for sale and never will be.

THE PART WORTH POSTING

No title can be bought. Not one of the eleven earned cards keys on holding more, ripping more or burning more – a balance can be borrowed for a single block, a feat cannot. The studio judges them and says so openly, because no machine can referee “did you actually do this.”

Not a picture with effects on it — a sheet of card stock that went through a press.

Each card's artwork is **separated into four process inks**, and every ink is laid down at its **own registration** and screened at its **own angle**. The misregistration and the moiré are not filters applied to a picture: they **fall out of printing one picture four times with the plates slightly wrong**.

Ink **multiplies** the paper and never adds — the one line that keeps the whole thing on the paper side of the fence instead of looking like a screen. The die edge is real foil: thin metal whose hue walks as you turn it, because it is reflectance rather than a rainbow painted on top.

AND IT MOVES WHEN YOU DO

Press the card and the stock dishes under your thumb, then rings when you let go. Keep handling it and **the sheet advances** — a new impression, new registration, a new ink film.

Nothing runs on a clock. Left alone, a card is a card sitting on a table. Every bit of motion is something *you* did to it.

One edition. Minted once. It only shrinks.

3,300,000

SUPPLY · MINT-ONCE

4 TIERS

1,600 → 1,100 → 600 → 260 PACKS

30.7%

OF THE MINT BURNED IF ALL FOUR
SELL OUT

50 / 50

EVERY PACK — HALF BURNED, HALF
FUNDS THE STUDIO

⊖ THESE TWO GO TOGETHER, ALWAYS

The split sends the **same number of tokens** to the fire and to the studio. So “the burn is meaningful” and “the treasury is large” are **the same arithmetic** — at this cap the studio ends up holding a substantial share of everything still alive. Quoting the burn without the treasury is the misleading half. The site states both in one breath and so should any post.

A tier opens when the one before it **SELLS OUT** — not on a date. That is deliberate. A season is a promise about *time*: miss one and it is a public failure at something nobody had to promise. A tier is a promise about **supply**, equally honest whether it takes three weeks or three years.

△ Pack and token pricing are announced at launch, once the live curve has actually been read. Please don't quote a figure before then — there isn't a verified one yet.

Six cabinets. Your cards are the pieces.

THE CITY explore

A **3.84 km generated city** – 32×32 streamed chunks. Be a bird, squirrel, cat or dog; or fly a jet; or walk it as an operative. **The animals cannot be hurt or targeted**, so a firefight two streets over is weather: something to fly over, watch, and photograph.

SECTION 9 tactical

First-person, six arenas plus baked levels. Bots take cover, flank and suppress; ~1.3 s time-to-kill so cover is worth using.

DOGFIGHT air combat

Height and speed are **one currency** – climbing spends it, diving buys it back. Raymarched clouds with self-shadowing.

RIP ROCKETER on-rails

Vertical shooter – bases, turrets, ship variety.

CLOUD RACER anti-grav

Sky racing through a real cloudscape.

THE ARENA 1v1

Wager cards and \$3030 into a pot; the podium takes it, first place the most. A small rake burns.

THE HOOK

A **photograph you take in the city becomes a card**. A trading card is a **size** before it is anything else – and so is a photo. Explore, notice, frame, shoot, and it is in your binder. It is the rip and the reveal in another key, and the prize is a thing you **made** rather than a thing you won.

Two contracts of our own. Both small enough to read in one sitting.

We write the contracts; SuperRare provides the platform. The edition itself is a SuperRare Liquid Edition – `name()` `ripmaster3030`, `symbol()` `3030`, deployed by the artist from his own verified wallet via the Rare Protocol CLI.

CONTRACT	WHAT IT IS	SIZE
<code>Ripmaster3030Lens721</code>	the deck – ERC-721 + on-chain renderer + voucher mint	16,155 B
<code>Ripmaster3030Renderer</code>	edition passthrough – reads <code>getMarketState()</code>	–
<code>PackSink</code>	the 50/50 split, in one atomic call	1,773 B

`solc 0.8.24`, viaIR, 0 warnings. 55/55 EVM tests on the lens.

WHY PACKSINK EXISTS AT ALL

A pack burns half and pays half. **That cannot be two client-side transactions** – a wallet can sign the burn and reject the transfer, and the collector's tokens are destroyed, the studio is unpaid, and no pack is owed. There is no ordering that fixes it, because there is no atomicity between two signatures. So it is one contract call.

No owner, no admin, no upgrade, no pause. Both destination addresses are `immutable`. It holds nothing between calls, and `flush()` is permissionless *because* its destination cannot change – opening it to everyone grants no power, while an owner-gated sweep would have added the admin key the contract exists to not have.

A card is a function of chain state, evaluated when someone looks at it.

`tokenURI()` is the edition passthrough; `tokenURI(uint256 id)` renders a specific card. Ids **1–100** render whether or not they have been minted – the 67 field lenses are render-only, so OpenZeppelin's revert-on-nonexistent is wrong here and is deliberately not used.

The renderer reads the edition's `getMarketState()` and derives burn from `maxTotalSupply - totalSupply`. SuperRare's own documentation names the available inputs: **price, supply, liquidity, burn progress and balances**.

Holding is one of those inputs. `tierOfHolder()` reads your \$3030 balance and the card renders it – Ash · Spark · Ember · Flame · Inferno, anchored on the pack rather than round numbers: one pack, ten, a hundred, a thousand.

No staking contract. No emissions. Nothing to drain, and nothing to claim – the art acknowledges you, it does not pay you.

THE ONE THAT MUST NEVER REVERT

`tierOfHolder` is called from `tokenURI`, so a revert would take the metadata of **all 100 cards** offline at once, on a marketplace, and permanently as far as any cache is concerned.

It has two guards, and `try/catch` alone is **not** enough: Solidity's contract-existence check fires *before* the call and is not catchable. So an explicit `code.length == 0` test is load-bearing – without it, pasting a wallet address where the token's belongs reverts the whole deck. **Found by a test, not by reasoning.**

No build step. No framework. Everything fails open.

FRONT END

Plain HTML, CSS and JavaScript.
No bundler, no framework, no build. What is in the repo is what the browser runs.

3D

PlayCanvas (MIT, UMD, no build step) for the cabinets and the card. Cards are rendered in **WebGL2**.

ART PIPELINE

Blender → GLB, plus a dependency-free **FBX reader** that handles binary 6.x/7.x and ASCII – it reads files Blender refuses.

TESTS

21 suites, ~1,190 assertions, headless Chromium. Every one proved to bite by reverting its own fix.

FAIL OPEN — THE ONE STANDING RULE

No WebGL2, a blocked script, a 404 on a manifest, a chain that will not answer: **the page is still the page it was**. Not a spinner, not a broken frame – the flat card, the readable document, the working link. Several test suites exist only to **break** the build and check that it degrades rather than dies.

DETERMINISM

`Math.random` appears **nowhere** in the card renderer. Every seeded quantity comes from one hash of the card's own identity, and every animated quantity is integrated from a caller-supplied clock. **The same card renders byte-identically on any machine, forever** – which is what makes a 1/1 a 1/1 rather than a lucky frame.

Quotable, accurate, and safe to publish.

"The token burns so the art can live."

"A card studio that ships a token – not a token that ships cards."

"Every card is a lens: it reads the chain and changes with it."

"Not a picture with effects on it – a sheet of card stock that went through a press."

"Eleven of the thirty-three heroes cannot be bought. Only earned."

"A tier opens when the last one sells out – not on a date."

"The anti-casino: the same anticipation, and the prize is the having-done-it."

PLEASE DON'T POST

- **Any price** – pack, token, market cap or FDV. The opening price is set by the curve at deploy and has not been measured yet.
- **Any return, yield or upside framing.** Holding does nothing but change how your cards render. No staking contract, no emissions, nothing to claim.
- **"Deflationary" as a headline** without the treasury share beside it.

Everything is **NFA**, and the site says so on every page. It is an experimental art token and it can go to zero.
